The 180' x 240' pre-engineered building houses a powder coating production line and shipping/receiving facility, with finished office space and a 2,520 SF roof covered shipping area. The powder coating production line includes prep booths, self-contained air scrubbers, and multiple gas-fired convection cure ovens. High pressure gas lines were installed throughout the building along with separate water lines with a below grade oil water separator for treatment of effluents.

The facility required the design and installation of a unique air handling system with self-contained exhaust, forced combustion air, wall mounted exhaust fans with powered intake louvers, and multiple welded high temperature exhaust stacks. All lighting is on a closed loop system with gasketed metal halide low-bay fixtures.
